

Product Data Sheet

Single use frying oil tester kit
Reference 93000

Specifications

Description

These small tests measure the polar compounds found in the frying oil to determine its quality. Frying is a cooking technique that can propagate great amounts of fat and others substances (polar compounds) that can be considered as toxic. These polar compounds can be harmful to health, more specifically to heart and arteries, as well as it can originate the manifestation of malignant illnesses such as lung and stomach cancers.

Keep away from kids. Open and handle with care. Do not eat, do not drink. Avoid contact with skin. In case of contact with eyes, rinse immediately. In doubt, contact a doctor.
